Fusing Surface Monitors, Satellites and Forecasts for Near-real-time Air Quality

Barron H. Henderson

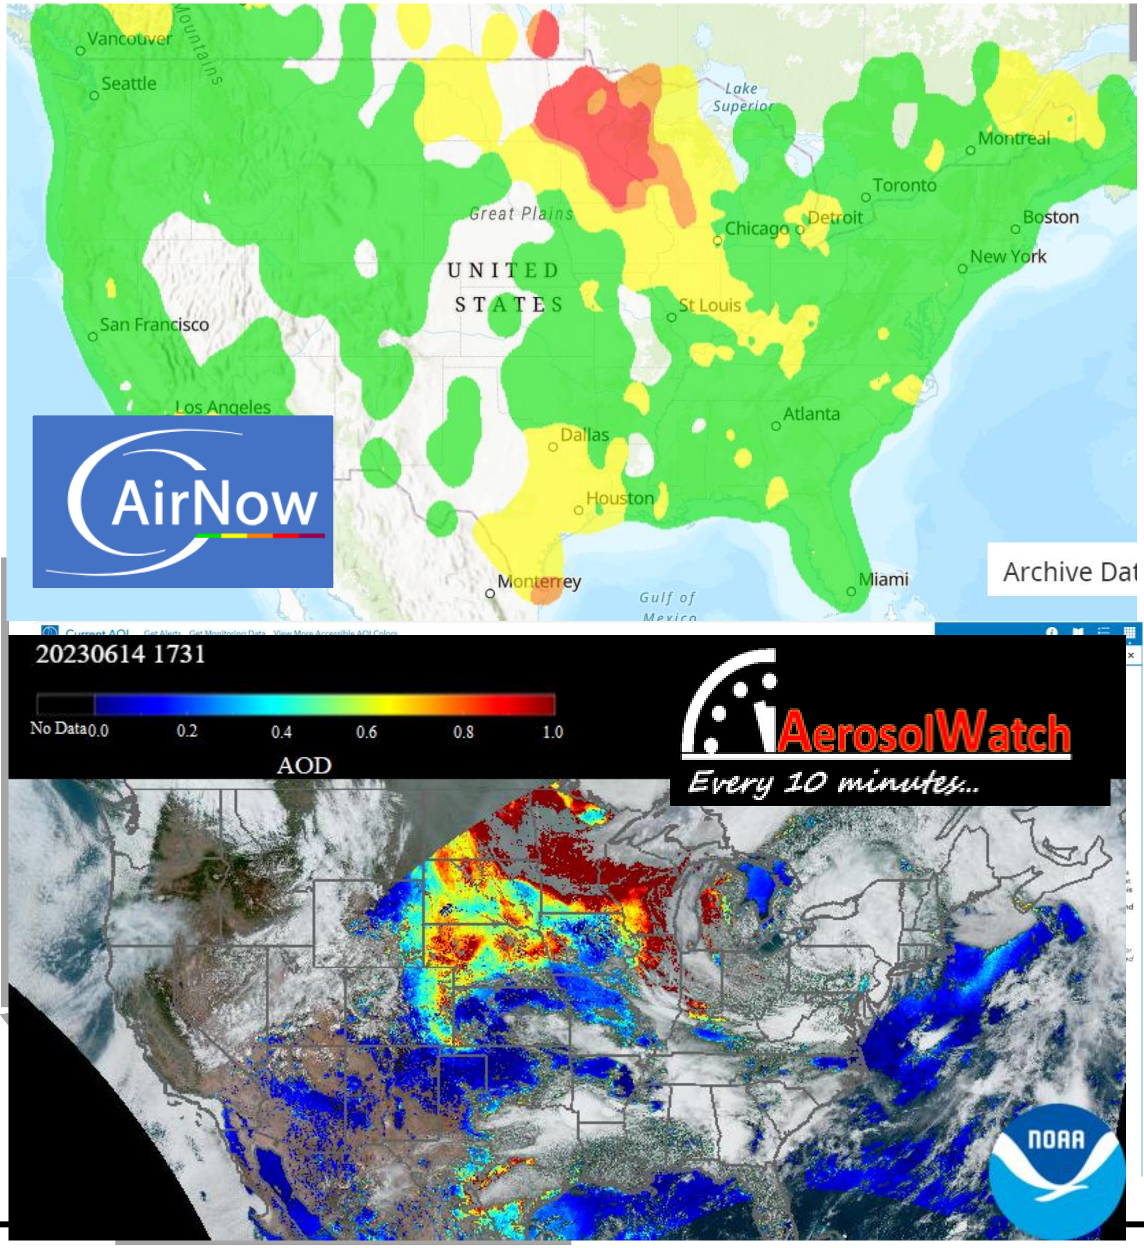
2023-10-04

Co-authors: Pawan Gupta, Shobha Kondragunta, Phil Dickerson, Alqamah Sayeed, Hai Zhang, Janica Gordon, Halil Cakir, Brett Gantt, Benjamin Wells, and HAQAST AirNow Team

Motivation

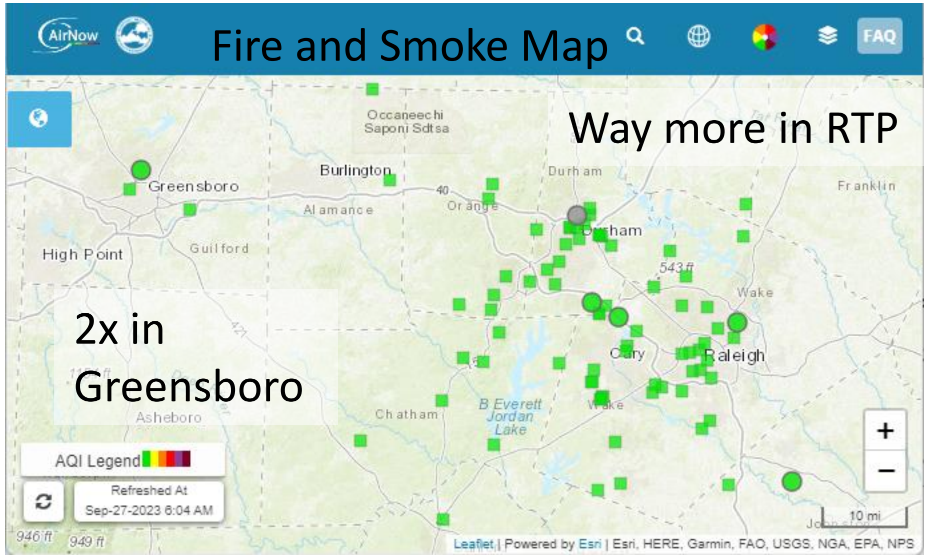
- AirNow communicates air quality in real time
  - Millions of visitors per day during fire seasons
  - Simple distance (d^{-5}) contours monitors only
- 4x more PurpleAir sensors than monitors
  - Increased the spatial coverage of monitored particulate matter.
  - Spoiler alert: sensor data improves predictions.
- Near-real-time satellite observations
  - Recent development by NOAA/NESDIS/STAR
  - NASA HAQAST project connecting AirNow to NOAA geostationary satellite data
- What about fusing AirNow, PurpleAir and satellites?

Example Day in AirNow and Aerosol Watch



Monitors and PurpleAir sensors

- Many agencies report monitor data to AirNow
  - ~1000 reporting monitors per hour
  - Publicly available thru AirNowAPI
- Schulte et al (2020) using PurpleAir
  - Residual Kriging with both AirNow and PurpleAir
    - NOAA Forecast model
    - Model Correction : $Y = M_n - \text{Krig}(M_n - O_n)$
  - Improved performance of PM2.5 in leave-one-out validation and compared to Federal Reference Monitors
- We use corrected PurpleAir low-cost sensors
  - Barkjohn et al. 2021 developed a national correction
  - Extended correction via RSIG



Better RMSE in Los Angeles

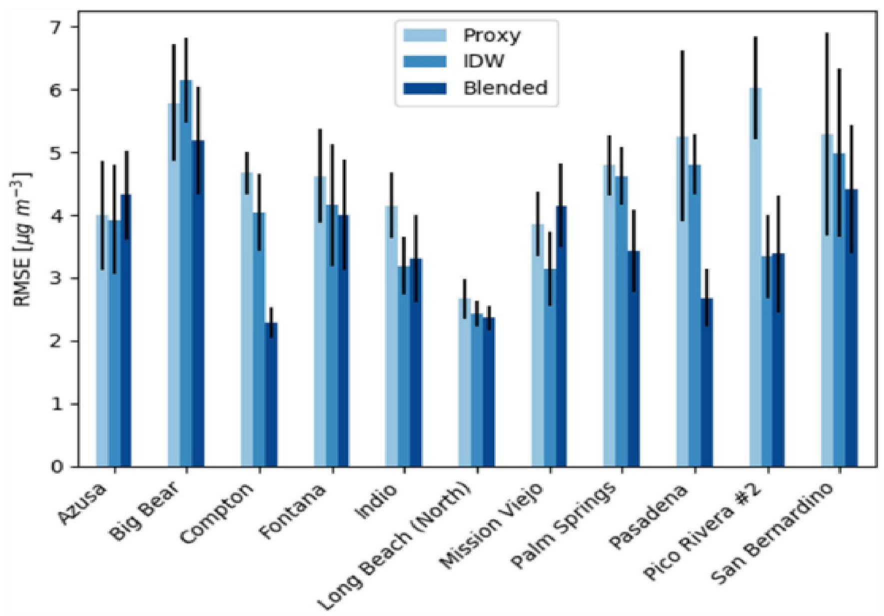


Figure 2. Root mean square error for $PM_{2.5}$ at each regulatory ambient monitoring station calculated using the independent gravimetric data. The RMSE is calculated from the 24-hour average concentrations. Vertical black solid lines are 95% confidence intervals.

Schulte et al 2020 (10.1088/1748-9326/abb62b)

4. **Enabling USEPA to ingest high-frequency satellite air quality data into the AirNow system**

Team Lead: HAQAST investigator Pawan Gupta

Partners: Phil Dickerson and Barron Henderson with the US Environmental Protection Agency (EPA), and Shobha Kondragunta with the National Oceanic and Atmospheric Administration (NOAA)

HAQAST Members and Collaborators: Jianqiu Mao, Yang Liu, Kel Markert, Robert Levy, Randall Martin, Amber J. Soja, Martin Stuefer, Jenny Bratburd, Emily Gargulinksi, Yanshun Li, and Daniel Tong also contribute to this team.

Hourly National-scale Fusion Ensemble

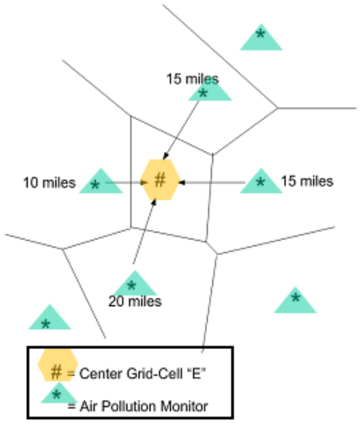

Figure courtesy of: Brian Timin

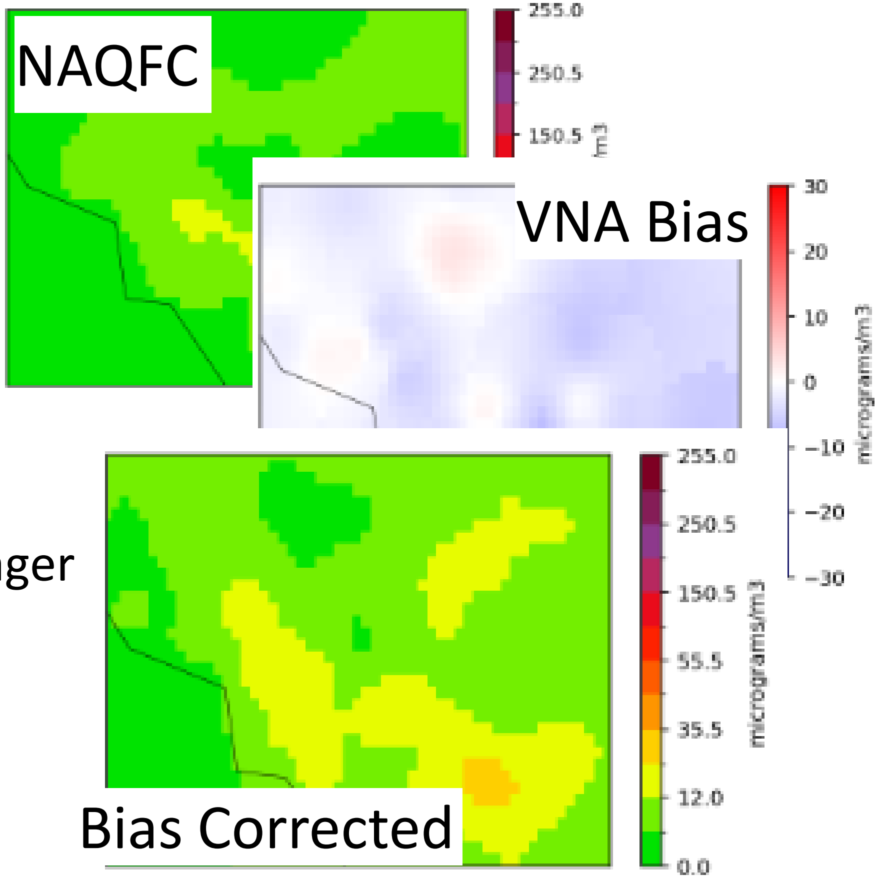
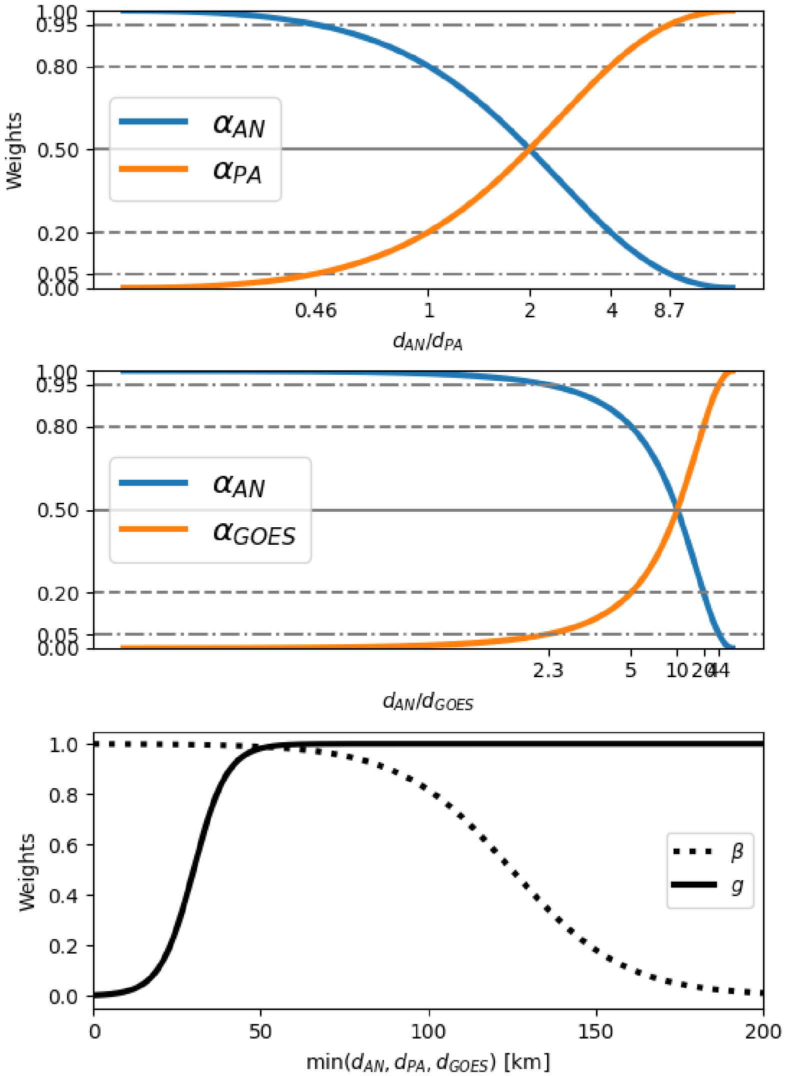
- Interpolating bias to "correct" the forecast model*
  - NOAA's Forecast Model (NAQFC) as mediating layer
  - VNA Bias = $\text{sum}(d_n^{-2}(m_n - o_n)) / \text{sum}(d_n^{-2})$ • n = Voronoi Neighbor
  - Y_i = NAQFC – VNA Bias_i
- One layer from AirNow (Y_{AN}) ***observations***:
  - mostly regulatory grade hourly observations
  - paired with collocated grid cell.
- One layer from PurpleAir (Y_{PA}) ***observations***:
  - low-cost sensor hourly observations with calibration**
  - Aggregated within grid cells to create a pseudo-observation
- One layer from GOES-PM25 (Y_{GOES}) "***observations***"
  - Geostationary Operational Environmental Satellite (GOES)
  - Aerosol Optical Depth from the GOES Advanced Baseline Imager
  - Geographic Weighted Regression (GWR) against AirNow
  - Deep Neural Network Corrected (Sayeed et al *in prep*)



*A multiplicative corrector of this type is called extended VNA (eVNA)
**Piece-wise regression as in Fire and Smoke Map

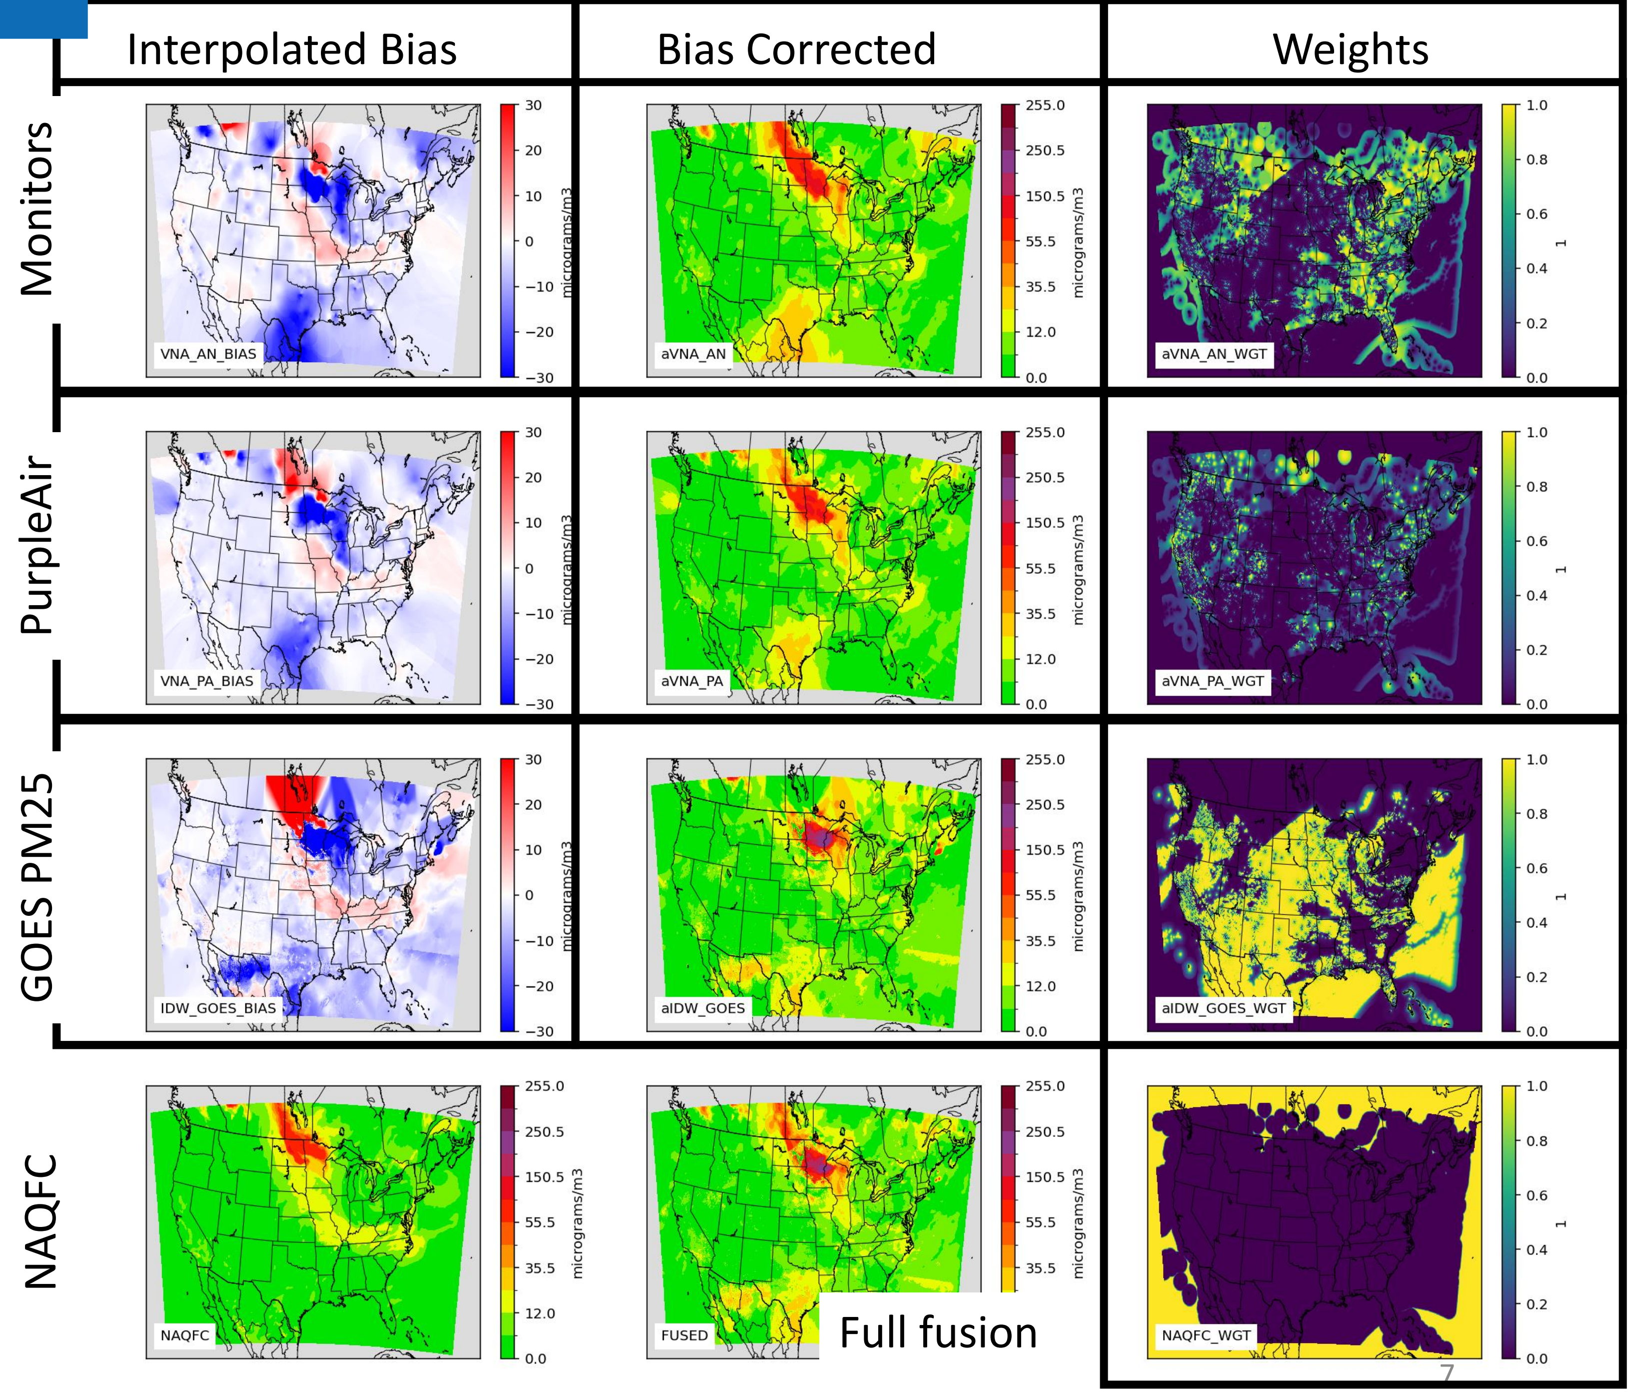
Ensemble Averaging Method

- Simple fusion of bias corrected surfaces
  - NAQFC, AirNow, PurpleAir, GOES-PM25
  - Fuse the surfaces based on distance
  - Apply different weights to ensembles
- $Y_{AN,PA,GOES} = \alpha_{AN} Y_{AN} + \alpha_{PA} Y_{PA} + \alpha_{GOES} Y_{GOES}$
  - $\alpha'_{AN} = (1 \times d_{AN})^{-2}$
  - $\alpha'_{PA} = (2 \times d_{PA})^{-2}$
  - $\alpha'_{GOES} = (10 \times d_{GOES})^{-2}$
  - $\alpha'_{tot} = \alpha'_{AN} + \alpha'_{PA} + \alpha'_{GOES}$
  - Normalize them all: $\alpha_i = \alpha'_i / \alpha'_{tot}$
- $Y_{AN,PA,GOES} = \beta \times Y_{AN,PA,GOES} + (1 - \beta) \times Y_{NAQFC}$

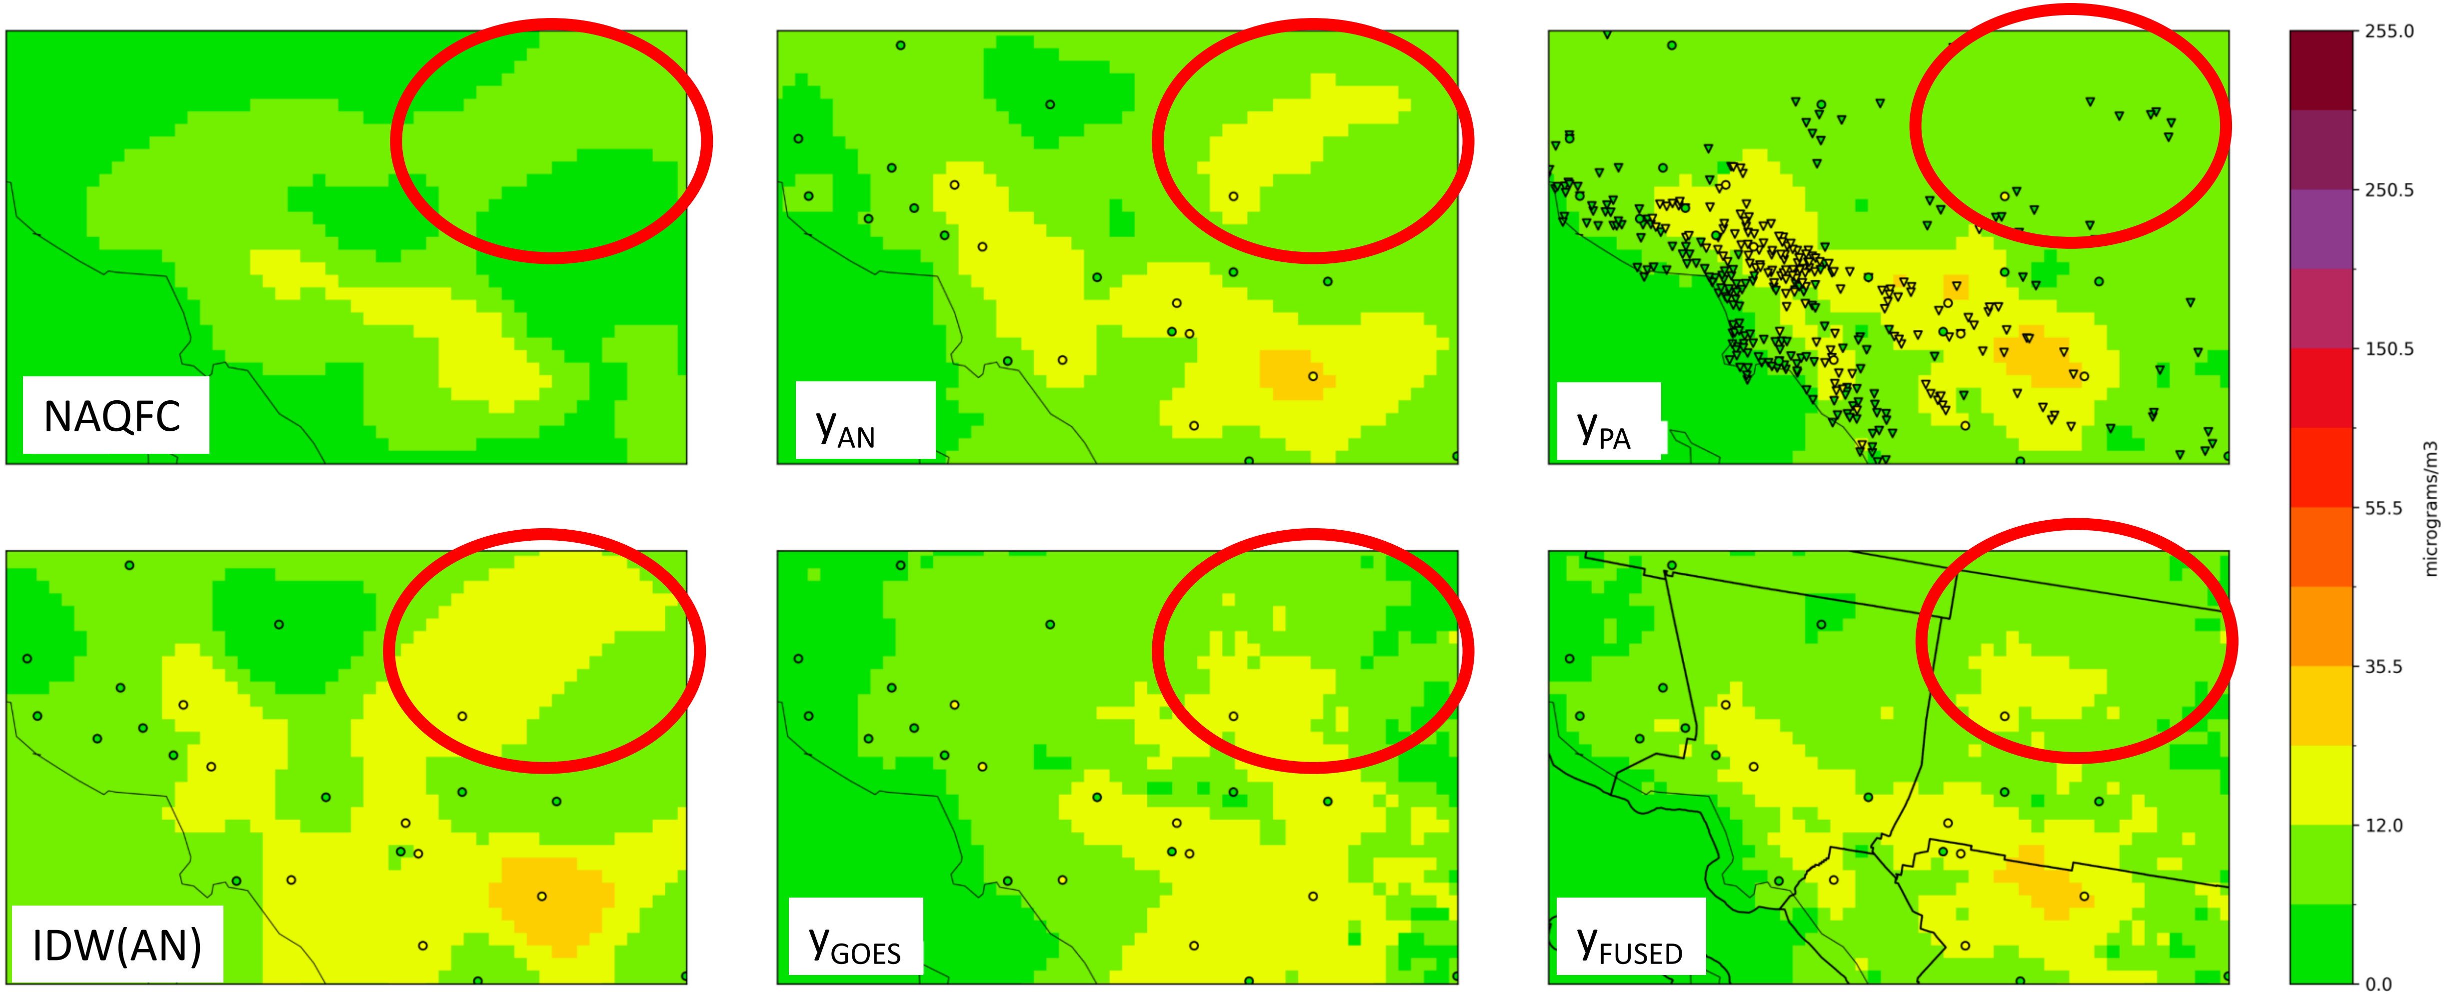


Case Study 2023-06-14T17Z

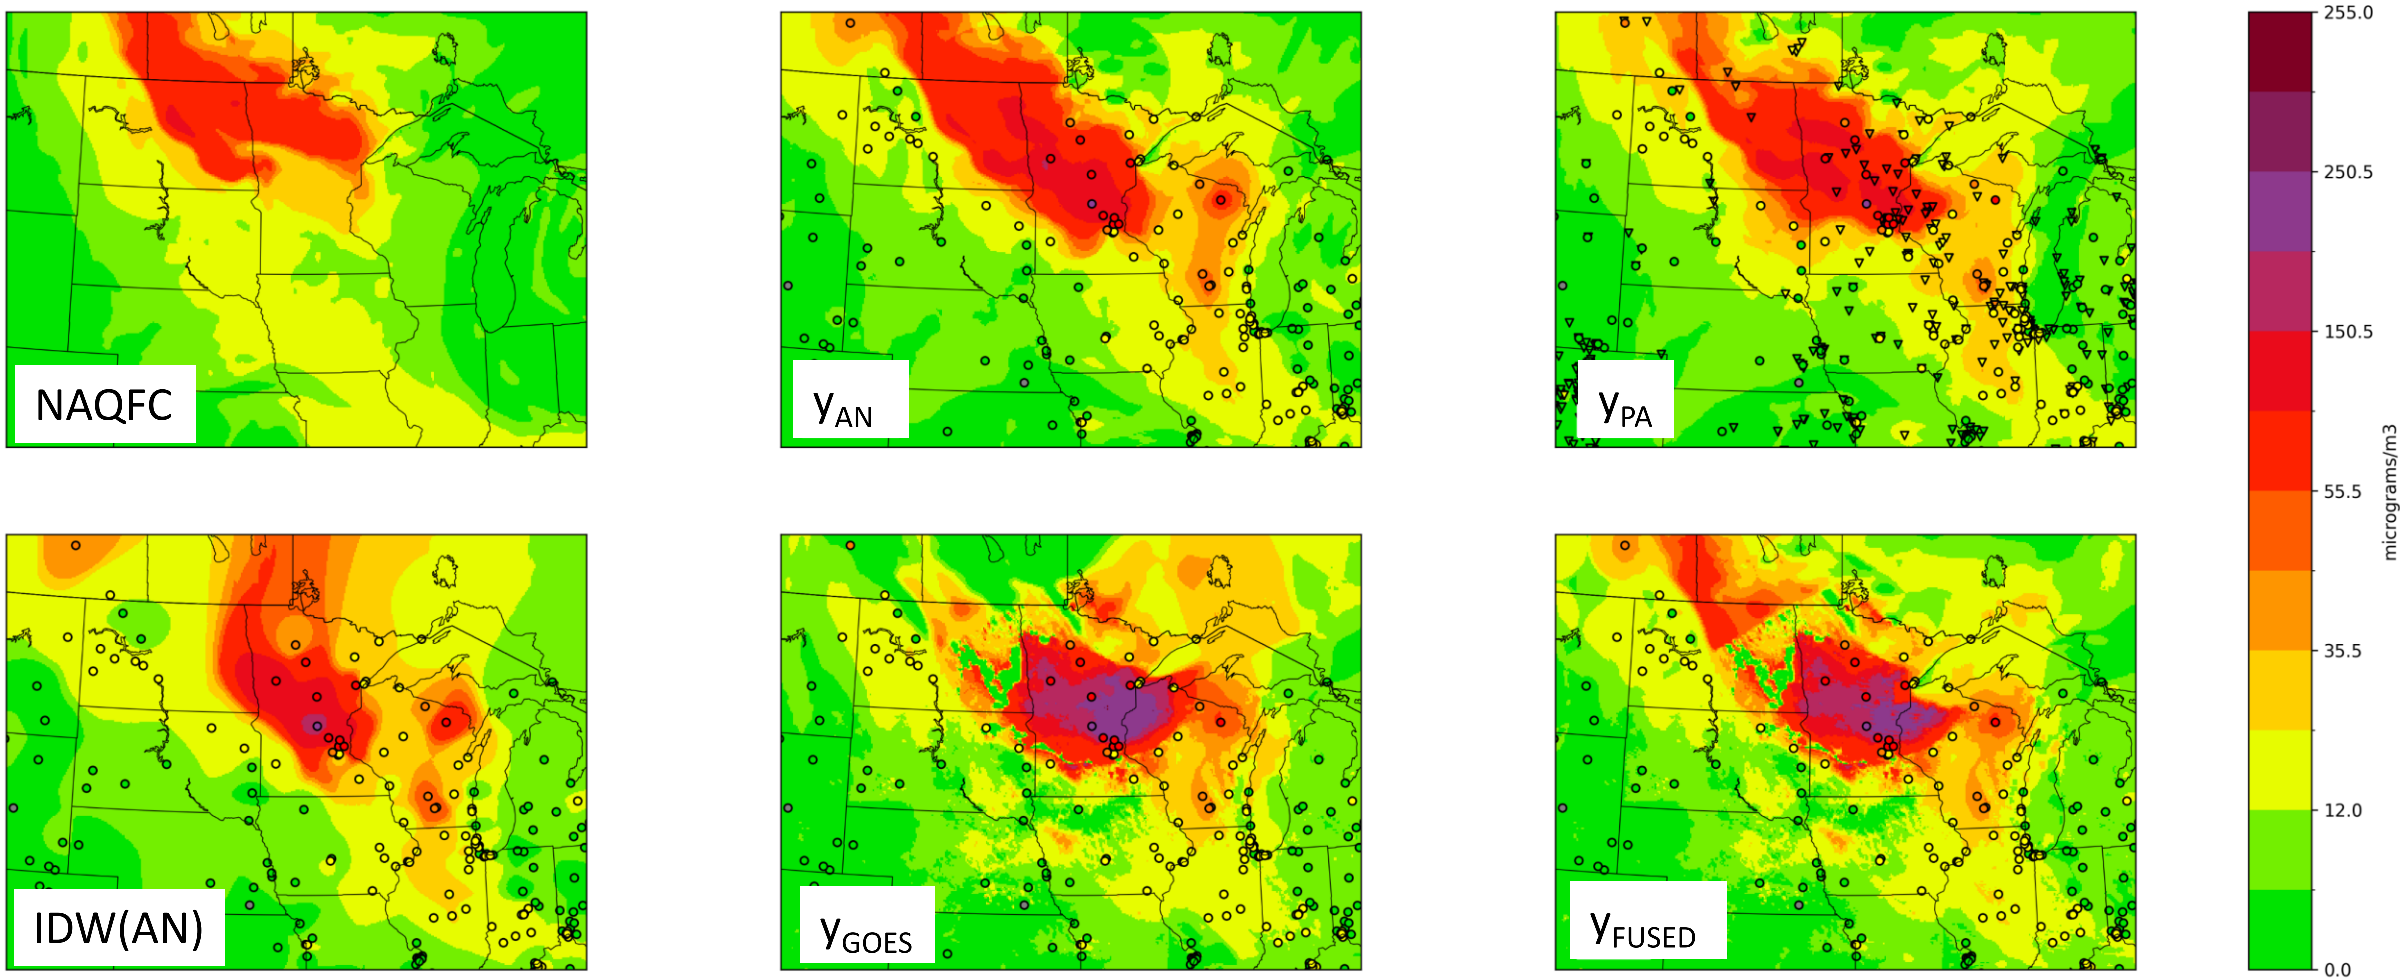
- Fairly typical day June day in the south western domain.
- Large fire contributions in Canada anc sweeping down through Minnesota, Wisconsin and further
- 4 data sources
    - AirNow Monitors (top)
    - PurpleAir sensors
    - GOES PM25
    - NAQFC (bottom)
- Estimates
- Bias Corrections
- Full fusion



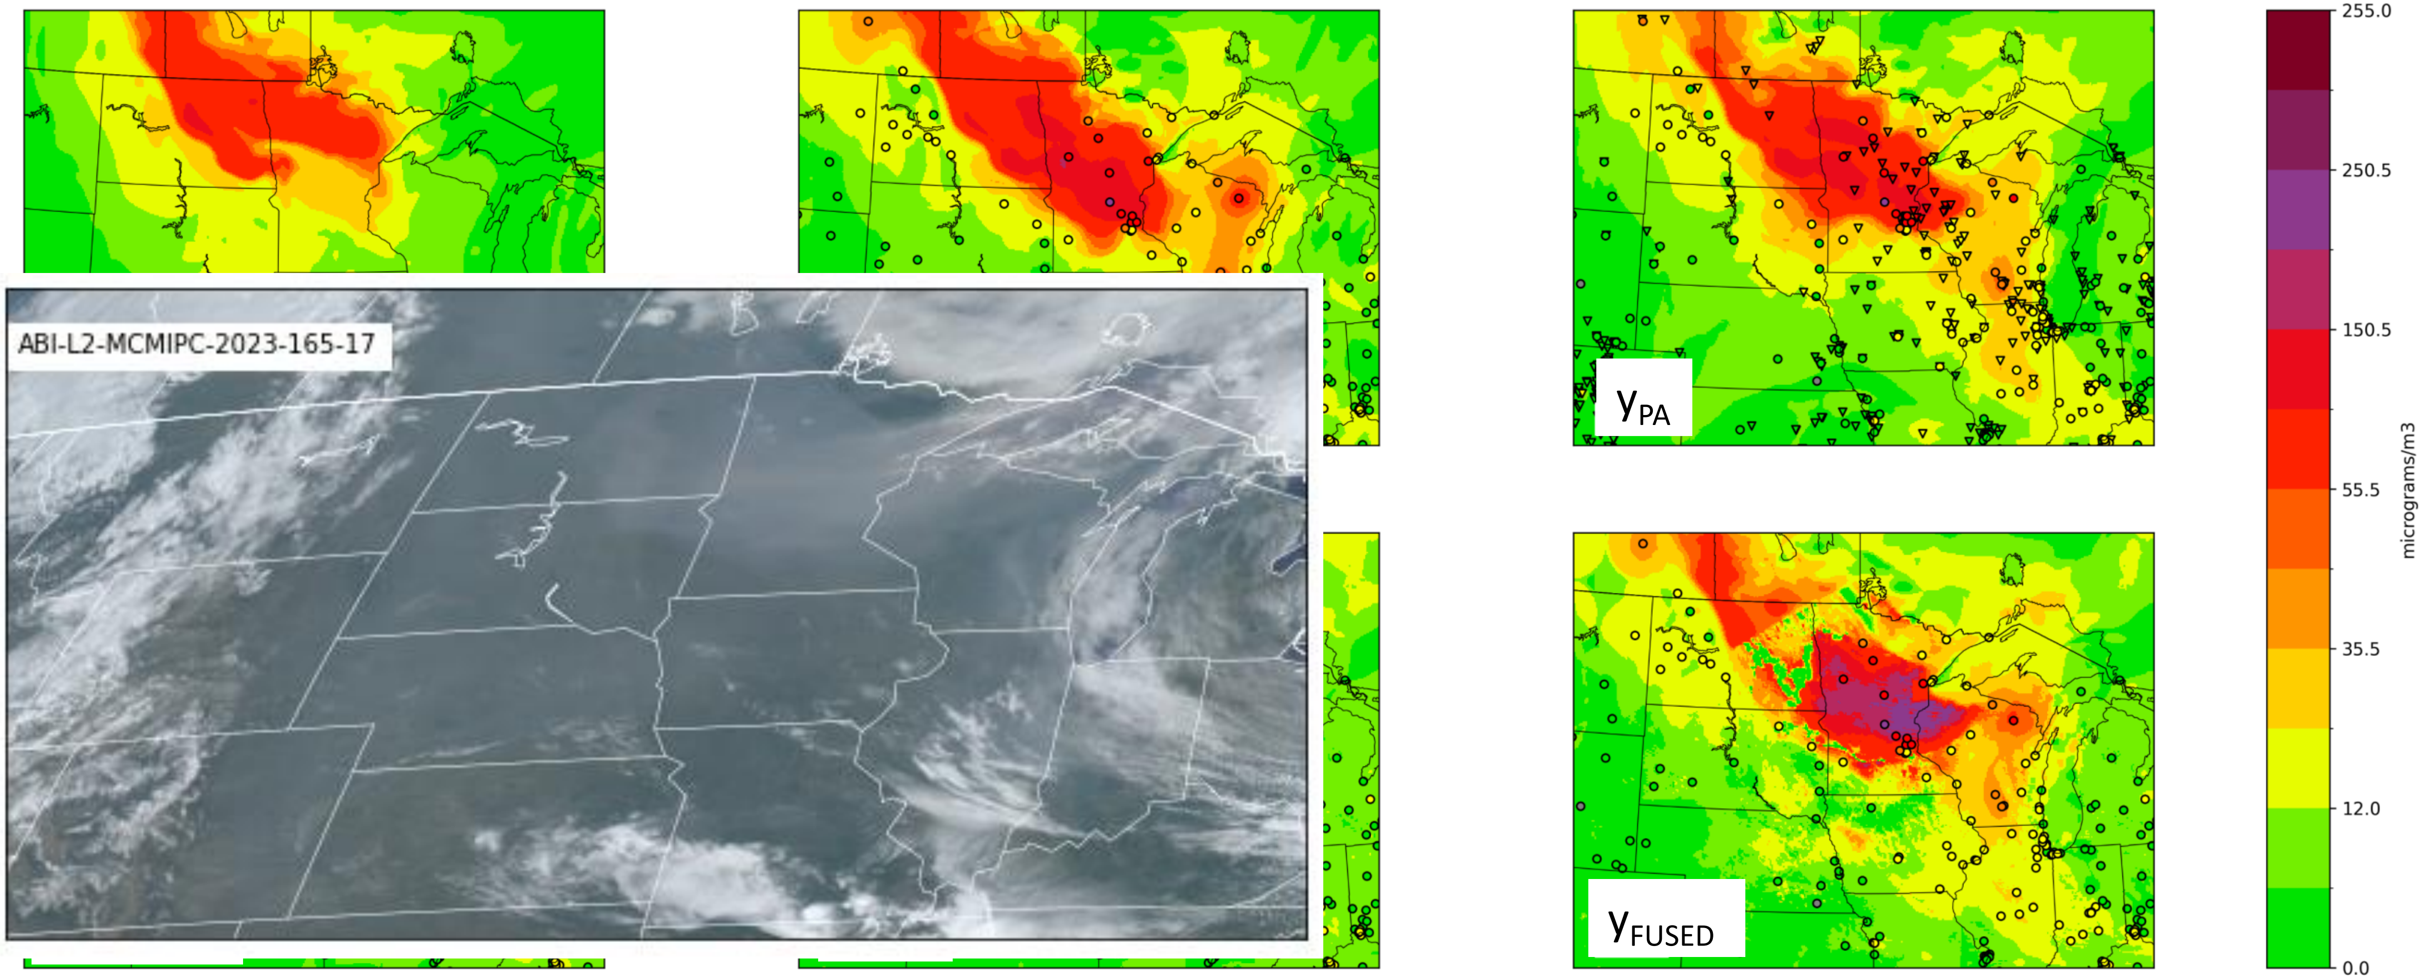
Los Angeles: 2023-06-14T17Z



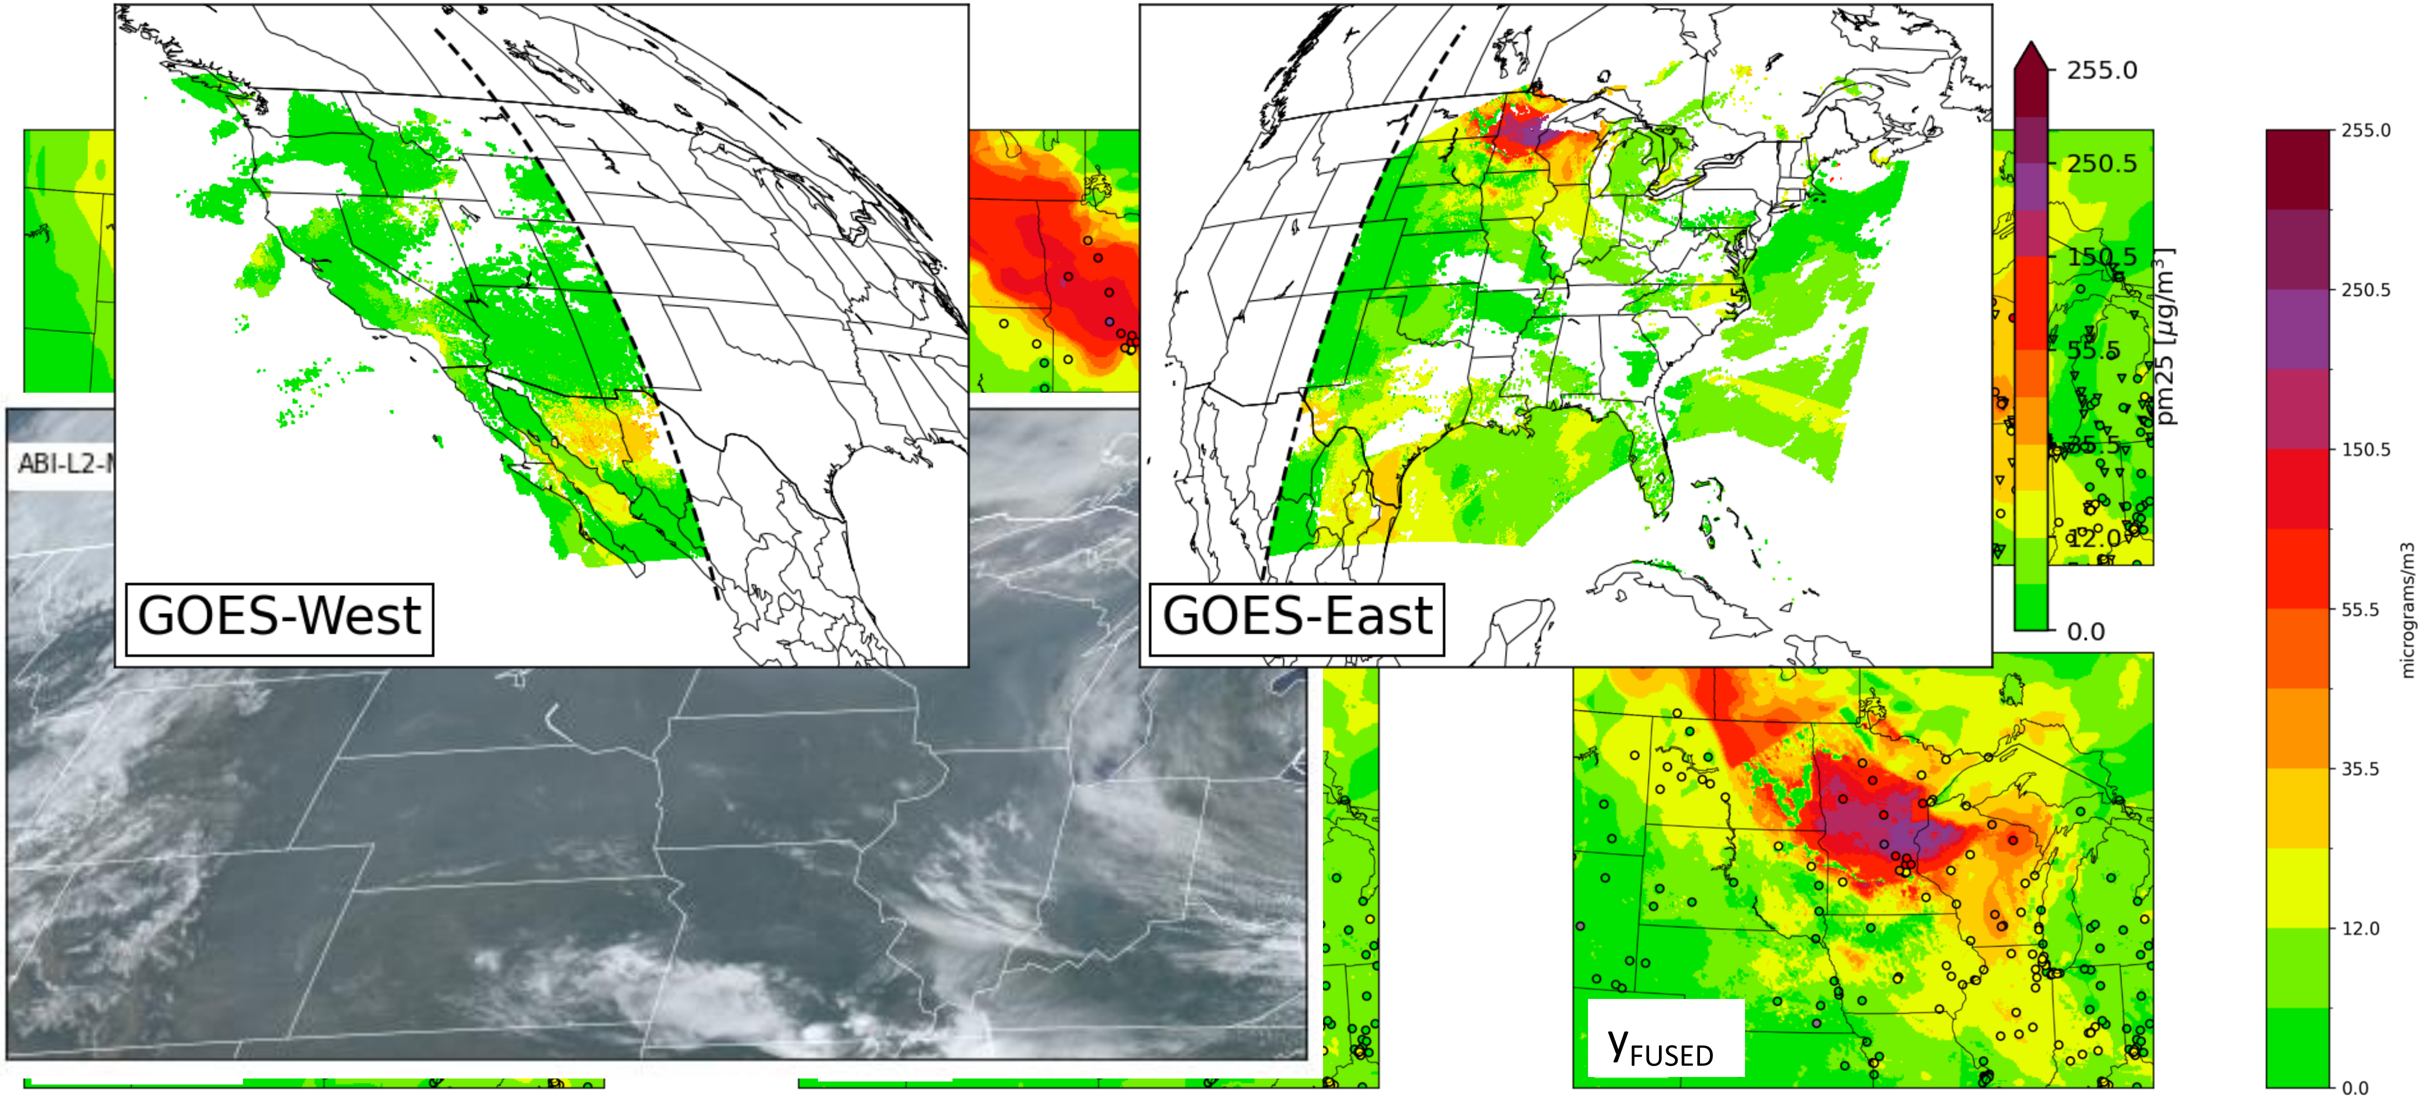
Canadian Wildfires: 2023-06-14T17Z



Canadian Wildfires: 2023-06-14T17Z

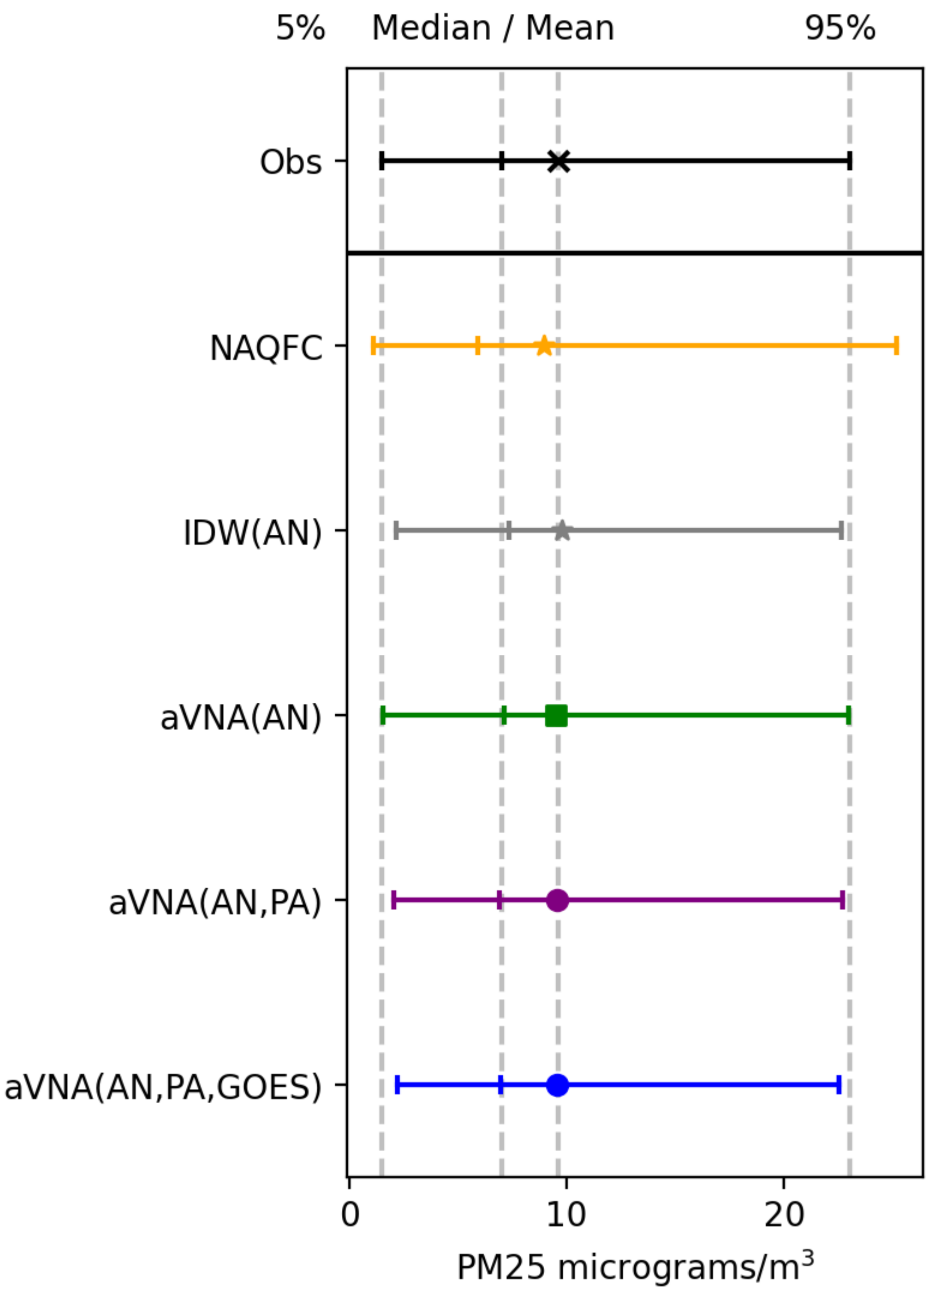


Canadian Wildfires: 2023-06-14T17Z



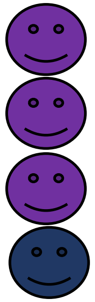
Evaluating the approach

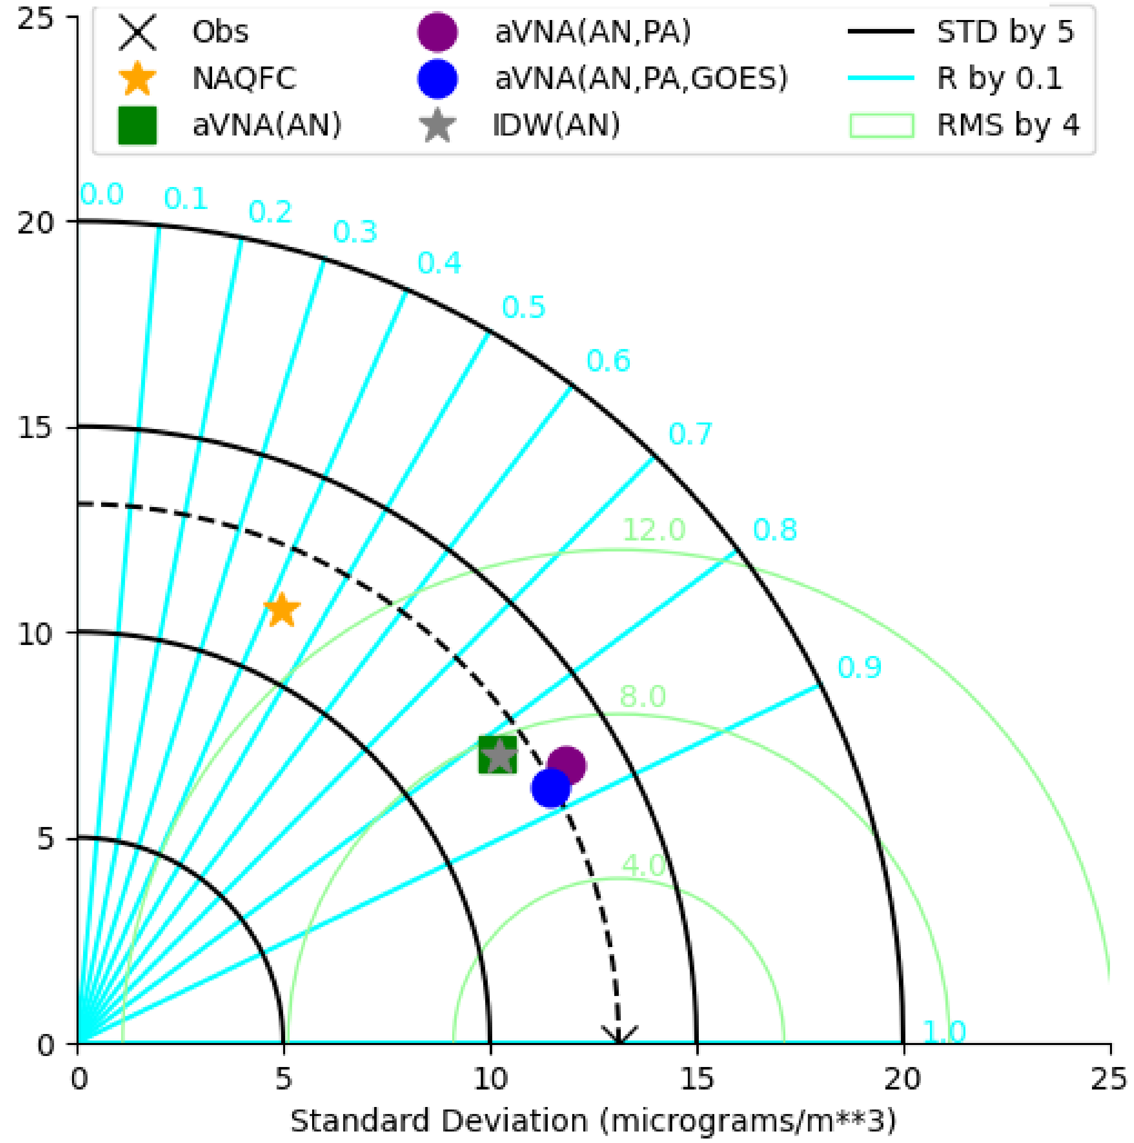
- That was just one hour…
- Applied daylight from Jun 2023 to Sept 2023
  - IDW as in AirNow (*)
  - NAQFC from NOAA (*)
  - Corrected w/ AirNow: AN
  - Correction w/ AN and PurpleAir: AN+PA
  - Correction w/ AN, PA and GOES: AN+PA+GOES
- Predicted each AirNow monitor without that monitor in the fusion
  - n=1.3M = 12 h/d * 30 d/m * 3.75m * 1000 /h
- Statistics: Normalized Mean Bias, Normalized Mean Error, RMSE, Correlation.



Performance Summary: June-Sept 2023 (daylight hours; n=1.3M)

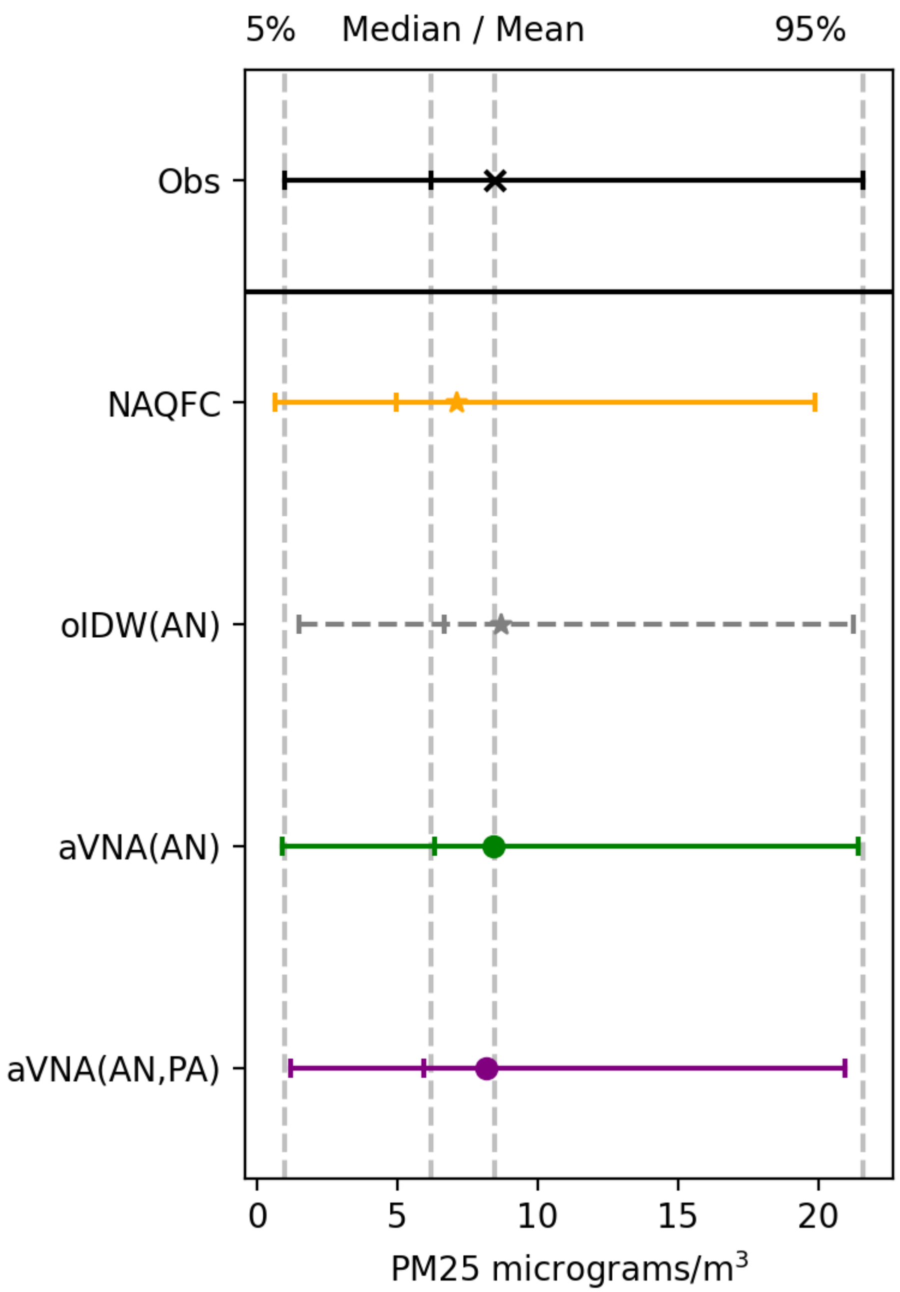
- Multiple statistics matter
  - Pearson correlation (y-axis)
  - centered Root Mean Squared Error (x-axis)
  - Reproduction of standard deviation
- The NAQFC has the lowest correlation, the highest RMSE, and the worst standard deviation.
- The AirNow and IDW have similar correlation, AirNow has better standard deviation.
- The fusion with PurpleAir improves standard deviation, correlation, and root mean squared error.
- The fusion with GOES is even better.





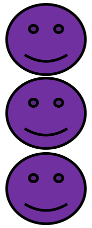
Evaluating the approach

- That was just one hour…
- Applied hourly data from Jun 2021 to Jun 2022
  - IDW as in AirNow (*)
  - NAQFC from NOAA (*)
  - Corrected w/ AirNow: AN
  - Correction w/ AN and PurpleAir: AN+PA
  - ~~Correction w/ AN, PA and GOES: AN+PA+GOES~~
- Predicted each AirNow monitor without that monitor in the fusion
  - n=8M = 8760 h/y * 1000 /h
- Statistics: Normalized Mean Bias, Normalized Mean Error, RMSE, Correlation.

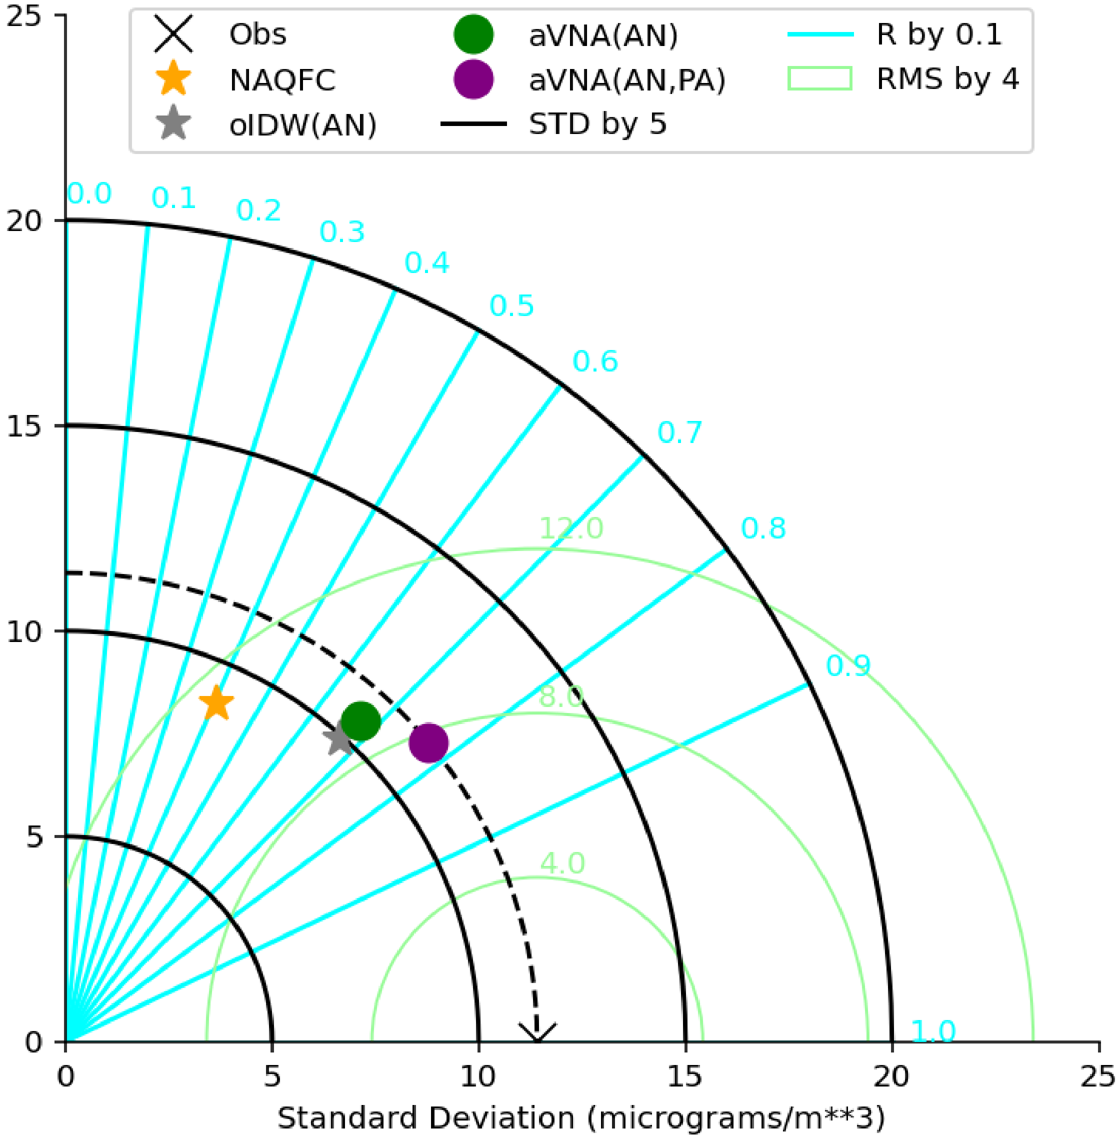


Performance Summary: June 2021-June 2022 (All hours; n=8M)

- Multiple statistics matter
  - Pearson correlation (y-axis)
  - centered Root Mean Squared Error (x-axis)
  - Reproduction of standard deviation
- The NAQFC has the lowest correlation, the highest RMSE, and the worst standard deviation.
- The AirNow and IDW have similar correlation, AirNow has better standard deviation.
- The fusion with PurpleAir improves standard deviation, correlation, and root mean squared error.

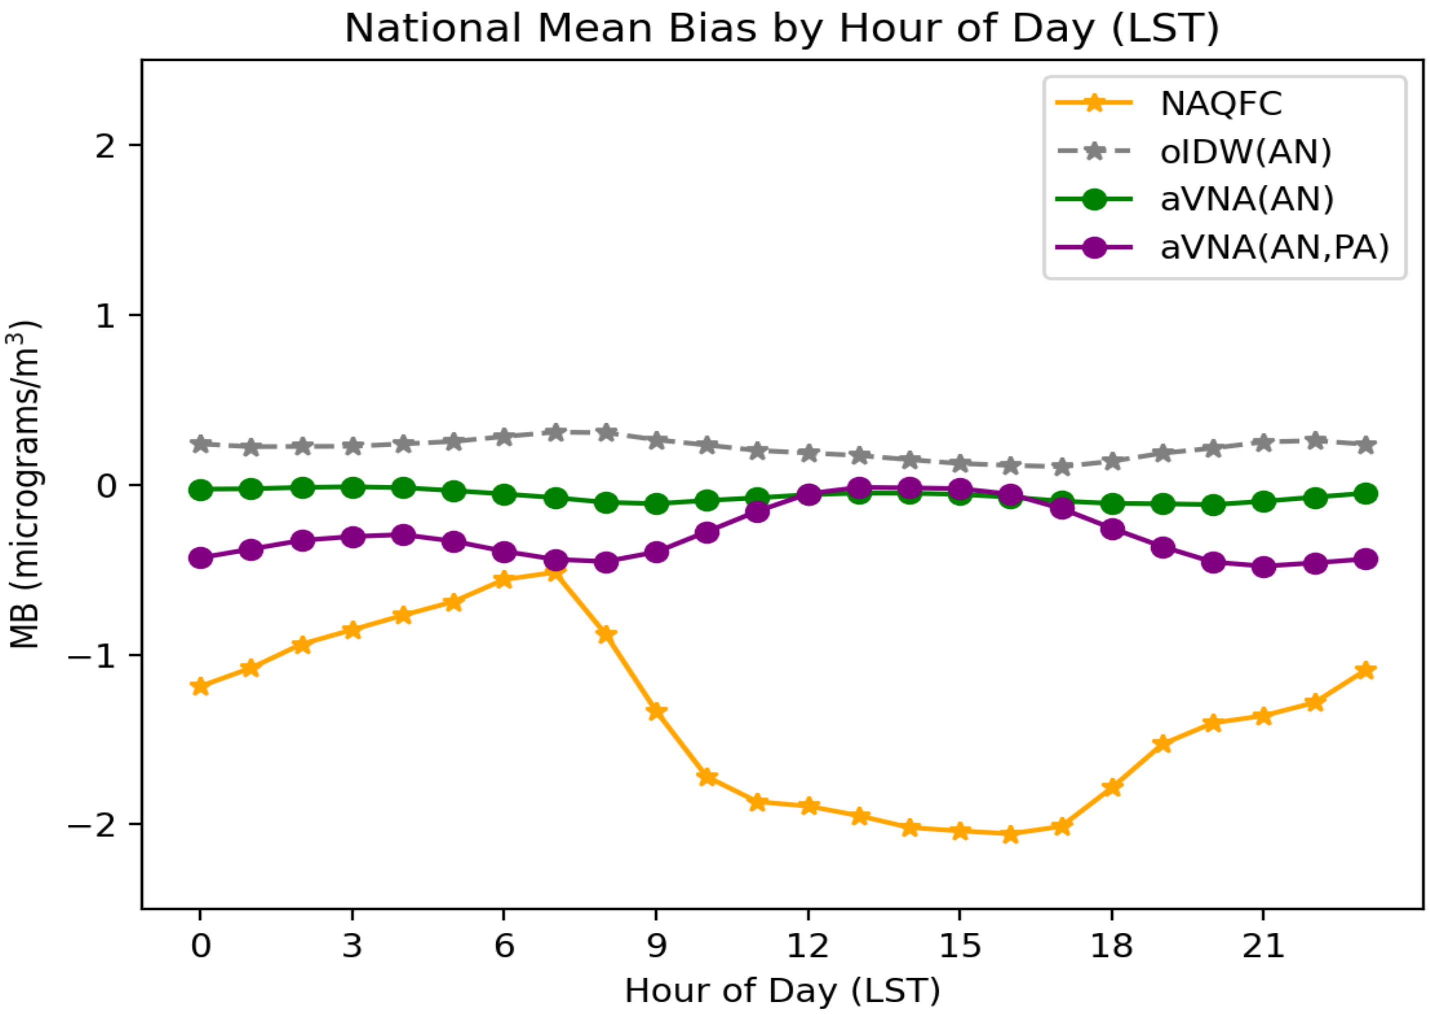


- Is the story more complex? When does one fail and the other succeeds?



Leave-1-out Validation National Mean Bias

- oIDW and aVNA(AN) have the most consistent bias.
- aVNA(AN,PA) has highest bias at night but is still quite good.
  - Currently, we use a single bias correction for PurpleAir.
  - Humidity varies with time of day and may need more complex correction.
  - Also, FEM technologies are evaluated most strictly for daily average concentration.
- Remember, this is validation. In application, the prediction at the monitor is equal to the monitor.



Summary

- AirNow needs an updated interpolation method.
  - EPA has long used models and statistical fusion to fill gaps with regulatory but has not incorporated these methods into AirNow.
  - Schulte et al. demonstrated including models and PurpleAir improved on simple interpolations and applied it in an AirNow-like system.
  - HAQAST Tiger Team evaluated GOES PM25 for real-time-applications.
- Fusion with PurpleAir is ready.
  - Discontinuities are less stark because datasets are more spatially consistent.
  - Value of PurpleAir is obvious because they are dense near monitors.
- Fusion with GOES PM25 ongoing work
  - HAQAST Tiger Team 2021 (Gupta) – now 2023 (Yang Liu)
  - Conceptually, the satellite value is highest away from monitors and sensors… making it hard to evaluate
  - ~5% of monitors are further than 30km from their nearest withheld monitor…
